SUMMARY

Software Engineering student with hands-on experience building production-oriented NLP, recommender, RAG, and predictive analytics systems. Skilled in Python, Scikit-learn, TensorFlow, LangChain, and FastAPI, with experience developing end-to-end applications from model training and deployment to clean, RESTful API architecture. Also brings prior experience as a Technical Recruiter, sourcing and evaluating candidates for technical roles.

PROJECTS

HR Assistant RAG Chatbot GitHub

Python, LangChain, Groq, FAISS, HuggingFace Embeddings, FastAPI

- Built a RAG chatbot that answers employees' HR policy questions strictly from retrieved policy documents, using a Groq LLM, local HuggingFace embeddings, and a persistent FAISS vector store
- Implemented grounded answers with source citations (policy title, URL, snippet), country and policy-type metadata filtering, and follow-up question rewriting for multi-turn chat
- Designed a stateless FastAPI backend with an */unanswered* endpoint that logs questions the documents could not answer, showing HR which policies are missing or unclear

Customer Reviews Sentiment Analysis GitHub

Python, TensorFlow/Keras (LSTM), FastAPI, Streamlit, Docker, Docker Compose

- Built a full-stack sentiment analysis application that classifies customer product reviews as Positive or Negative using a trained LSTM deep learning model
- Architected a decoupled system with a FastAPI backend serving real-time predictions and confidence scores via a REST endpoint, paired with a Streamlit frontend for interactive use
- Containerized both services with Docker and orchestrated them via Docker Compose for one-command deployment, with prebuilt images published to Docker Hub

Customer Churn Prediction API GitHub

Python, Scikit-learn, FastAPI

- Built a machine learning classification model to predict the likelihood of customer churn from historical subscription and service-usage data
- Served the trained model through a FastAPI REST endpoint, enabling real-time churn-risk predictions for downstream applications

Job Recommendation System GitHub

Python, Scikit-learn, TF-IDF, Cosine Similarity, PyPDF, Streamlit

- Built an ML-powered web app that recommends relevant job postings by extracting and parsing text from a user-uploaded PDF resume
- Implemented TF-IDF vectorization and cosine similarity to rank job postings by relevance, surfacing a match-percentage score for each recommendation
- Deployed the application on Streamlit Community Cloud for public, interactive use

WORK EXPERIENCE

Technical Recruiter — Kinetic Hire LLC **May 2024 - January 2026**

- Managed the end-to-end technical recruitment lifecycle — sourcing, screening, and assessing candidates for technical roles across multiple open requisitions
- Coordinated and conducted candidate interviews and maintained recruitment pipelines, partnering with hiring teams to ensure timely, quality placements

EDUCATION

BS Software Engineering — The Islamia University of Bahawalpur **2023 - Present**
FSc (Intermediate, Computer Science) **781/1100**

SKILLS

Programming Languages Python
Frameworks & Technologies FastAPI, LangChain, FAISS
Machine Learning & AI Scikit-learn, TensorFlow, Supervised & Unsupervised Learning, TF-IDF Vectorizer, LSTM, Deep Learning, K-Means, NLP, RAG, Groq, Chatbots
Software Engineering REST APIs, Version Control, Git, GitHub, Object-Oriented Programming (OOP), Unit Testing
Tools VS Code, Jupyter Notebook, Google Colab
Soft Skills Adaptability, Communicator, Problem Solver, Team Collaborator

CERTIFICATIONS

Intro to Machine Learning — Kaggle **July 2026**
Python — Kaggle **July 2026**
Intro to Deep Learning — Kaggle **August 2026**
